Urban Ibile — Website and Mobile App Feature Brief

1. Website and mobile app

Build an e-commerce website and mobile app for Urban Ibile's own fashion products. Customers should be able to browse outfits, view their details, select sizes, add items to their cart and place orders.

Both platforms will share the same products, prices, stock and order records.

2. Main background video

The first section of the homepage should feature a large fashion video, the brand name, a short message and a button leading to the shop.

The design should take inspiration from the client's reference while using our own creative design. The video should play automatically and repeat when it ends.

Our team will source the temporary video. It can be replaced through the admin panel when the final video is ready.

Client's reference: <https://babalajestore.framer.website/>

3. Shop page

The shop page should display outfits using moving videos, with each outfit's name and price. The client wants a presentation similar to the walking models in his reference.

Visible outfit videos should play together. Customers can tap an outfit to open its full details.

Our team will source the temporary outfit videos while the client's products are being prepared. These can be replaced later through the admin panel.

Client's reference: <https://www.instagram.com/reel/DZIL-8OKrJz/>

4. Video playback

Videos should play automatically and restart when they finish, including the main background video and outfit details videos.

The client selected repeating videos without the proposed Play/Pause, Watch again and Full screen controls on the outfit details page.

5. Shared admin panel

The website and app will use one admin panel. Updates to shared content and shop records should appear on both platforms.

One or two selected admins should each have their own login. They should be able to manage products, descriptions, prices, available sizes, stock, videos, written content and orders.

Temporary videos and write-ups can be replaced whenever the final content is ready.

6. Up to 100 product videos

The shop should support up to 100 product videos.

Display 20 outfits per page, giving five pages when all 100 products are available. Customers should have clear controls for moving between pages.

Load the videos needed for the page being viewed.

7. Product search

Customers should be able to search by outfit name or clothing type, such as “shirt” or “trouser”.

Search should check all products, regardless of which shop page the customer is viewing. Results should display matching outfit videos, names and prices.

Customers can tap a result to open its details. If nothing matches, display: “No outfits found. Try another word.”

Product names will remain the same when customers switch between English and Pidgin.

8. Find my size and the cart

Place a “Find my size” option on each outfit’s details page. It should open a short form where customers enter the measurements needed to recommend a size.

The recommendation should follow the brand’s size chart or sizing rules. Customers who already know their size should also be able to select it directly.

Customers must confirm a size before adding an outfit to the cart. The cart should show the selected outfit, size, quantity and price, with options to change quantities or remove items.

Customers should also be able to reopen “Find my size” from the cart to check their size before paying.

Example sizing data can be used during development. Actual customer recommendations must use the brand’s confirmed sizing information.

9. English and Pidgin toggle

The website and app should open in English. Customers can switch to Pidgin without losing their current page or cart.

We will prepare the English website and app content and send it to the client. His professional writer will translate it into Pidgin and return it for us to apply.

This includes page content, navigation, instructions, cart, checkout and order messages. Product names will remain unchanged.

10. Fourteen QR codes and content pages

Create 14 different QR codes. Each code should open its own assigned content page on the website.

The pages will contain temporary written content initially. Admins can replace or update these write-ups later.

Keep each page's address unchanged so its QR code continues working after content updates.

11. Checkout, payment and delivery

After reviewing the cart, customers should tap "Proceed to checkout". They will then enter their contact and delivery details.

Show the order total, including the delivery charge, before payment. Delivery charges should vary by location using the fees supplied by the client.

Use Paystack for payments. Only confirmed payments should mark an order as paid. If payment fails, customers should be able to try again without losing their cart.

12. Customer accounts and order confirmation

Customers must create an account and sign in before buying. Their account should allow them to save delivery details and view previous orders.

After successful payment, show an order confirmation containing the order number, purchased outfits, sizes, quantities, total paid and delivery address.

Send an email copy to the customer's email address. The confirmed order should also appear in the admin panel for processing.

13. Performance for 5,000 active users

Build for a target of 5,000 people using the website and app at the same time, combined.

Prepare videos for faster loading while keeping outfits clear. Only videos visible on screen should play; videos outside the visible area should pause.

Before launch, test browsing, search, cart and checkout under the agreed level of activity. Performance will also depend on customers' devices and internet connections.

14. Shared stock and order management

The website and app should share the same stock records. Confirmed purchases should update the remaining stock across both platforms.

Admins should see orders from both platforms in one place, including customer delivery details, purchased outfits, sizes, quantities, total paid and payment status.

Admins should be able to update an order's status to "Being prepared", "Sent out" or "Delivered".

Details and responses still waiting for the client:

- **Colour choices:** His palette ratings and overall favourite have not been submitted.
- **QR code arrangement:** Where the codes will appear and how customers are expected to scan them.
- **Delivery fees:** The actual charges for each delivery location.
- **Delivery areas and timing:** Supported locations and expected delivery times.
- **Delivery arrangement:** He mentioned looking into Jumia Logistics. The final arrangement still needs confirmation.
- **Brand contact details:** Support email, phone or WhatsApp number, and social media links.
- **Return and exchange rules:** The policy customers should see on the website and app.
- **Sizing information:** The brand's size chart, required measurements and rules for recommending each size.
- **Pidgin content:** The approved translations will be needed after the English content is sent to the client's writer.

The brand name has been confirmed as **Urban Ibile**, and the selected payment provider is **Paystack**.
